Problem Statement: Online Shopping Cart Management Using ArrayList in Java

An e-commerce company wants to develop an Online Shopping Cart Management System using Java. The system should maintain a list of product names selected by a customer using the `ArrayList` class.

Create a class named `ShoppingCart` that contains an `ArrayList<String>` to store product names. Implement the following methods in the class:

1. `addProduct(String productName)` – Adds a product to the shopping cart.
2. `insertProduct(int index, String productName)` – Inserts a product at the specified index.
3. `displayProducts()` – Displays all products currently in the cart.
4. `updateProduct(String oldName, String newName)` – Replaces an existing product with a new product name.
5. `removeProduct(String productName)` – Removes the specified product from the cart.
6. `searchProduct(String productName)` – Checks whether the specified product exists in the cart.
7. `getTotalProducts()` – Returns the total number of products in the cart.

Create a separate class named `Main` containing the `main()` method to test the functionality of the `ShoppingCart` class.

Requirements:

- Use the `ArrayList` class to store and manage product names.
- Use appropriate `ArrayList` methods such as `add()`, `add(index, element)`, `set()`, `remove()`, `contains()`, and `size()`.
- Display suitable messages when a product is successfully updated, removed, or found.
- Handle cases where a product does not exist or an invalid index is provided.
- Display the final list of products and the total number of products after all operations.
