

Problem Statement: Restaurant Employee Duty Management System

A restaurant employs different categories of employees, such as **Chefs, Cashiers, and Waiters**. Although all employees are part of the same restaurant, each category performs a different type of duty.

Develop a **Java program using inheritance and method overriding** to represent the different employee roles.

Requirements

1. Create a base class named `Employee`.
2. Define a method `performDuty()` in the `Employee` class.
3. Create the following subclasses by extending `Employee`:
 - `Chef`
 - `Cashier`
 - `Waiter`
4. **Override** the `performDuty()` method in each subclass to display the specific duty performed by that employee.
5. Create objects of `Chef`, `Cashier`, and `Waiter`.
6. Invoke the `performDuty()` method for each object and demonstrate **method overriding**.

Expected Duties

- **Chef:** Prepares and cooks food.
- **Cashier:** Handles billing and payments.
- **Waiter:** Takes customer orders and serves food.

Sample Output

```
Chef Duty: Preparing and cooking food.  
Cashier Duty: Handling billing and payments.  
Waiter Duty: Taking customer orders and serving  
food.
```

Concepts Covered

- Inheritance
- Base Class and Subclasses
- Method Overriding
- Runtime Polymorphism
- Object Creation
- Method Invocation
